Leroy:

SWSES has a backhoe in their yard that can be used on a periodic basis as needed rather than renting and placing onsite for daily rental price even when not being used. There is an already established CLIN. This equipment should be available to us if not on another job an we can use it when needed.

I have an area in the South Poned area that needs to be removed and placed in a rolloff box before we get another rainfall event. Additionally, we have other soils that are covered with plastic in the back of the property that could also be placed in the same rolloff.

There is no need to go through the procurement process prior to bringing this equipment onsite to do work that is necessary. You can go ahead and do procurement activities for this equipment and a variety of other equipment and if we need it we can get it as necessary when we will be using it for extended periods of time.

I expect CB&I to utilize resources that are easily available and where CLIN rates are already established rather than going through the CB&I belabored procurement process.

Finally, I expect to have a detailed description (with copies of documents utilized for procurements) of the CB&I procurement process so that I am completely familiar with the process. More is not better when you are dealing with the EPA "Emergency and Rapid Response Services" Contract. The process should be quick and nimble and not long and drawn out.

Thanks

Gary Moore
